WE BELIVE IN INNOVATION

We bring innovation to RTC by implementing blockchain technology in the Real Time Communication marketplace and crowdfunding business models. Our goal is to promote blockchain and cryptocurrencies to the mass market by solving the traditional problems of investments in real time communications.

We look forward to a brilliant future where all real time communications registries are based on blockchain technology and can be combined into a transparent and secure worldwide distributed ledger that allows users to trade real time communications fast, without intermediaries and with low transaction costs. We are eager to partner with all government and private projects to make this future come true faster.

Although direct interaction with governments is very important in the long term, business is much faster to adopt innovations, especially when they directly affect financial results. Promotion of blockchain technologies to business leaders will increase the lobby for further steps in the adoption of blockchain registries.

We offer real time communications market players our Protocol for real time communications tokenization, and the Platform for exchanging tokenized real time communications assets. Tokenization enables trading real time communications in small fractions, and makes it accessible as a result. Sellers attract new buyers who could not afford to buy real time communications before, didn't have the opportunity to invest internationally, didn't want to bear high transaction costs, or wanted to pay for real time communications with cryptocurrency. Buyers are additionally motivated by the transparency and liquidity provided by the secondary market within the Platform and the secure transaction records stored on the blockchain.

Osmotic makes it possible to buy and sell tokenized real time communications assets in a trusted, fast and smooth manner with instantaneous transactions and low transaction costs. Any real time communications

WE BELIVE IN INNOVATION

owner can list his property or any fraction of it on the Platform, and anyone can become a buyer as the entry ticket is very low.

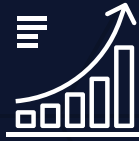

We are the first real time communications tokenization project with a viable B2B marketing strategy. We will provide our solution to real time communications developers, investment companies and brokers. As they are interested in any new sales channels, we can use their marketing budgets to promote our tokenization Protocol and quickly fill our exchange with tokenized real time communications from all over the world.

ABOUT THE PROJECT

We are building a fully Decentralized AI Powered RTC platform to make Remote teams life easier! Because we believe Remote working is essential as of today and the future!

The first decentralized AI Team collaboration which makes simplifies and standardizes data with blockchain technology. We provides user-friendly, efficient and secure crypto solutions and utilizing blockchain technology and we are building the platform to make remote teams feel like sitting in the same room!

THE PROBLEM

Investment Problems

There is no platform for investors to buy/share communication shares and make profit out of it.

Communication Problems

Currently, Teams are using meeting platforms to collaborate but that is not enough to solve their osmotic communication issue, So, There is no such a tool to make teams to collaborate better and efficient. It's hard to create meeting link and schedule meeting then get people together. Time wasting process.

THE SOLUTION

Solution

We are building osmotic platform to have investors to invest RTC business and make profit from teams communications.

Innovation

We are using AI to get teams together 24 hours a day and 7 days a week with Tensorflow AI implementation.

In details

Osmotic Solves the Main Problems of Traditional Real time communications Investments

Osmotic ROAD MAP

ABOUT THE INDUSTRY

The total value of world real time communications reached \$217 trillion in 2015 and is worth nearly 2.7 times the global GDP.¹ This number includes only developed real time communications, and would have been much larger had we counted the vast amount of undeveloped land around the globe.

Although the real time communications market has plenty of opportunities for making big gains, investing in real time communications is a lot more complicated than investing in stocks and bonds.

Several major problems and barriers persist in real time communications markets:

- High threshold for entry
- Lack of liquidity
- Slow and complicated process of ownership transfer
- Lack of price transparency
- Risks of fraud
- High transaction costs
- Complications of cross-border transactions

All of them have been addressed many times throughout history . New investment vehicles have been invented which solve some of those problems, but there is no perfect solution, and the real time communications market is still the most inefficient one compared to other asset classes.
